

CLARION

Turns 4,812 alerts into 6 decisions.

Threat correlation and plain-English briefing for the defence watch floor.

6 feeds fused

34 incidents found

6 need a decision

PROBLEM

Too many alerts. Too few people.

Six systems. Six formats. None of them talk to each other.

Who

A handful of analysts and one commander per shift.

What

Alerts from six systems that share no common format.

Why it hurts

The real threat is a faint signal spread across three feeds.
Nobody joins them up in time.

Miss a real threat and the damage is done. Chase a false one and the real attack runs free.

CLARION finds the few alerts that matter

What happens to 4,812 alerts in one watch

Scoring is fixed rules, not AI guesswork. AI reads reports in and writes the brief out.

How it is built

One example: three alerts, one warning

Radio
Jamming test at grid 42

Satellite
Vehicles gathering at grid 42

Cyber
Scanning Site 7's controls

Same site.
Same 14 hours.

IMMEDIATE Score 87
One incident, not three alerts

Why it scored 87

Different sensor types agree	25%
The site is critical	20%
The attack has progressed	20%
The alerts are severe	20%
It is happening now	15%

The radio and satellite alerts are not cyber activity — they back up what the cyber sensor saw and push the score up. That cross-check is what a single system cannot do.

How far the attacker has got

Each step is a known attacker move from the MITRE ATT&CK library.

THE BRIEF: Site 7 is likely being prepared for attack within 72 hours. Isolate the control network now and re-task satellite cover over the area.

Bob built it. watsonx runs it.

IBM Bob — building it

watsonx — running it

AI never sets the priority. It reads reports in, and writes the brief out. The ranking is fixed rules.

Where this goes next

NOW

Defence watch floor

Sits next to the systems a unit already has. Nothing is replaced.

NEXT

Working with allies

One shared language for attacker behaviour. One incident, different briefs for different partners.

BEYOND

Any control room

Ports, power grids, railways, borders, disaster response. Only the feed readers change.

What has to stay true

Analysts can argue with it

Every score and every dismissal can be challenged and overturned.

Adding a feed stays cheap

One new source is one new reader.

It can be certified

Fixed rules and a full log are the price of running on a secure network.

4,812 alerts in. Six decisions out.

And every one of them can be traced back to the alert that caused it.

Thank you

Questions welcome — including the hard ones about the scoring.
